

UML Diagrams

Prof. P. K. Das
Department of CSE
IIT Guwahati

What is UML?

- Standard language for specifying, visualizing, constructing, and documenting the artifacts of software systems, business modeling and other non-software systems.
- The UML represents a collection of best engineering practices that have proven successful in the modeling of large and complex systems.
- The UML is a very important part of developing object oriented software and the software development process.
- The UML uses mostly graphical notations to express the design of software projects.
- Using the UML helps project teams communicate, explore potential designs, and validate the architectural design of the software.

Overview of UML Diagrams

Structural

: element of spec. irrespective of time

- Class
- Component
- Deployment
- Object
- *Composite structure*
- *Package*

Behavioral

: behavioral features of a system / business process

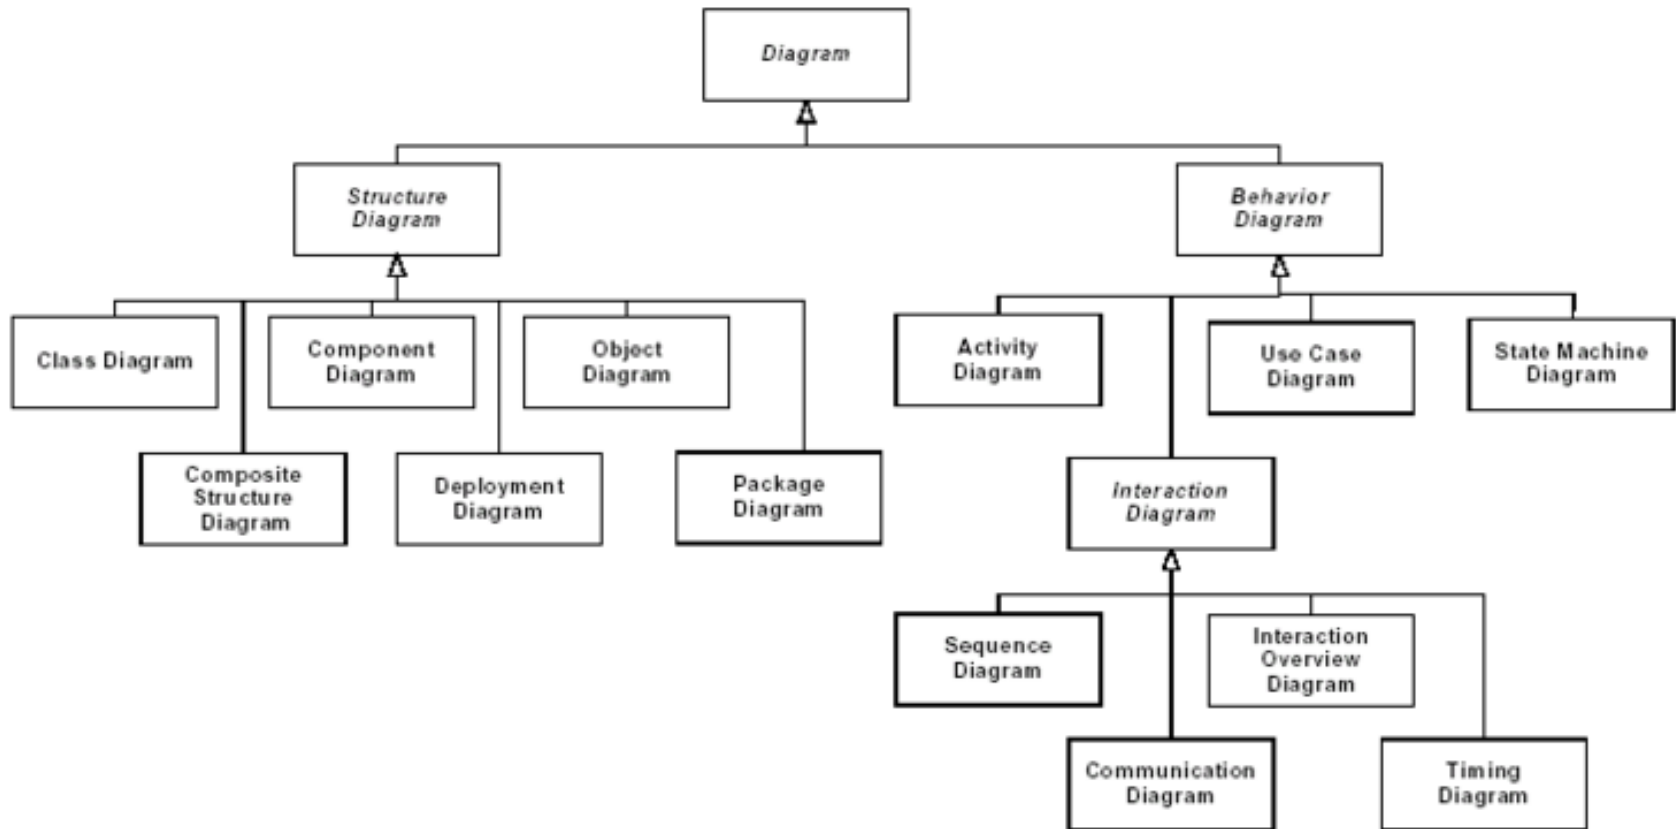

- Activity
- State machine
- Use case
- *Interaction*

Interaction

: emphasize object interaction

- Communication(collaboration)
- Sequence
- *Interaction overview*
- *Timing*

UML diagrams hierarchy

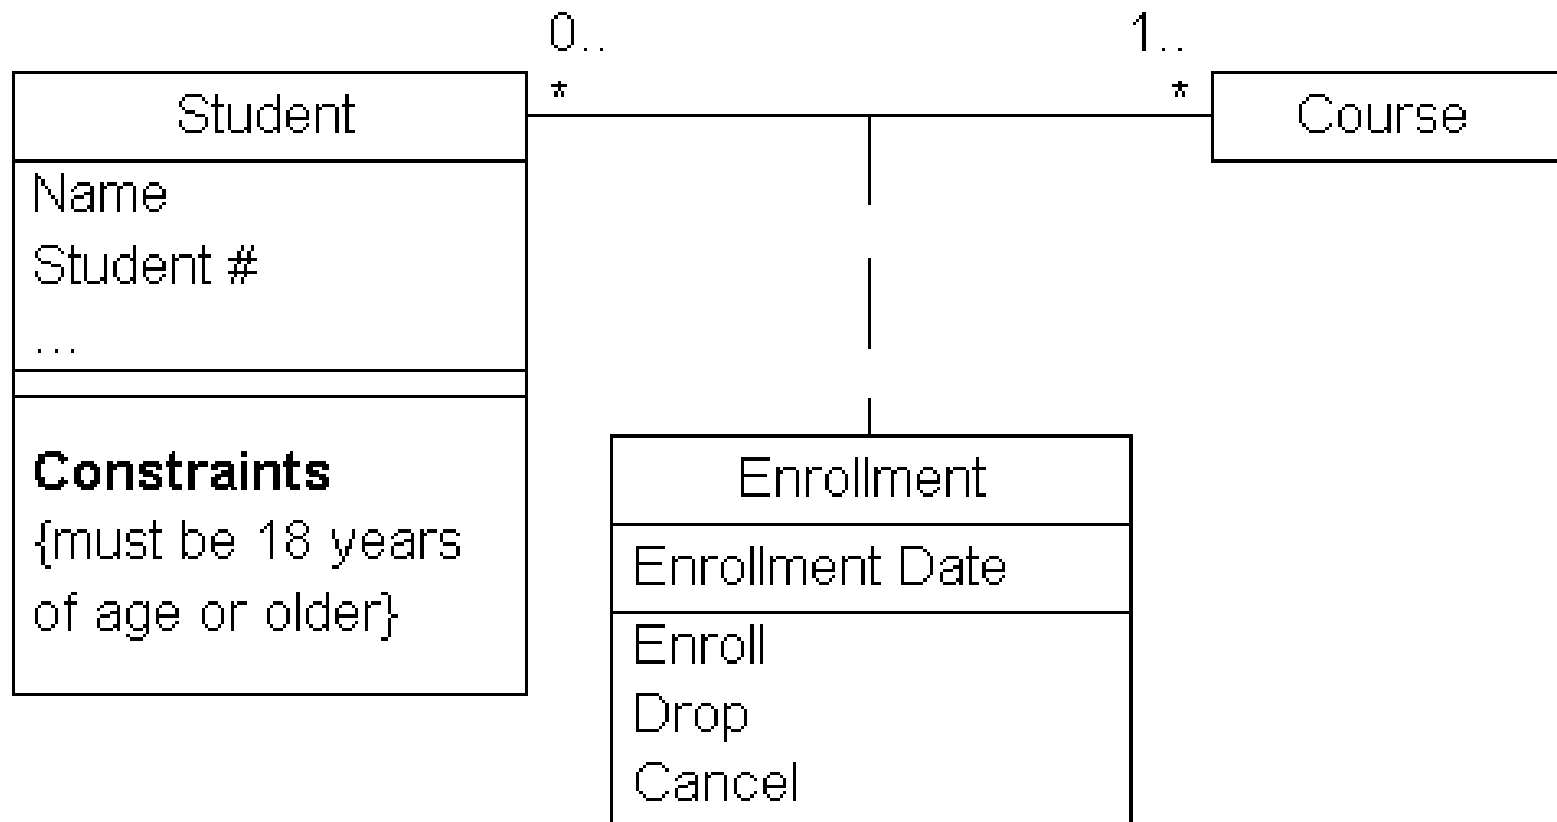

Class diagram

UML class diagrams show the classes of the system, their inter-relationships, and the operations and attributes of the classes

- Explore domain concepts in the form of a domain model
- Analyze requirements in the form of a conceptual/analysis model
- Depict the detailed design of object-oriented or object-based software

Class diagram

Class diagram

Component diagram

UML component diagrams shows the dependencies among software components, including the classifiers that specify them (for example implementation classes) and the artifacts that implement them; such as source code files, binary code files, executable files, scripts and tables.

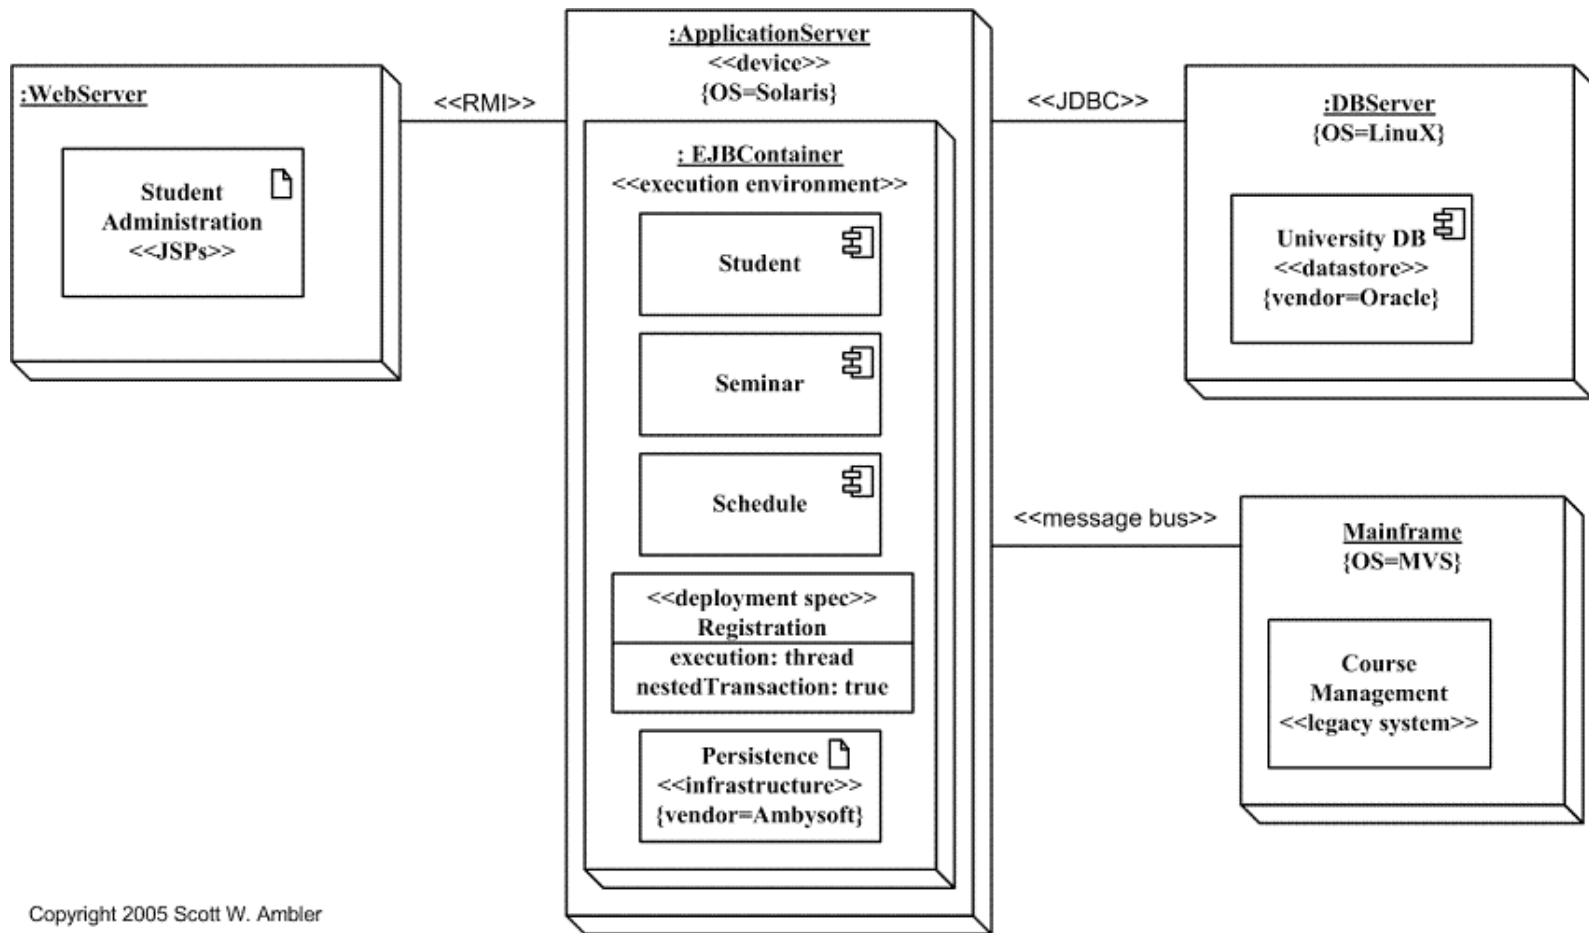

Component diagram

Deployment diagram

UML deployment diagram depicts a static view of the run-time configuration of hardware nodes and the software components that run on those nodes. Deployment diagrams show the hardware for your system, the software that is installed on that hardware, and the middleware used to connect the disparate machines to one another.

Deployment diagram

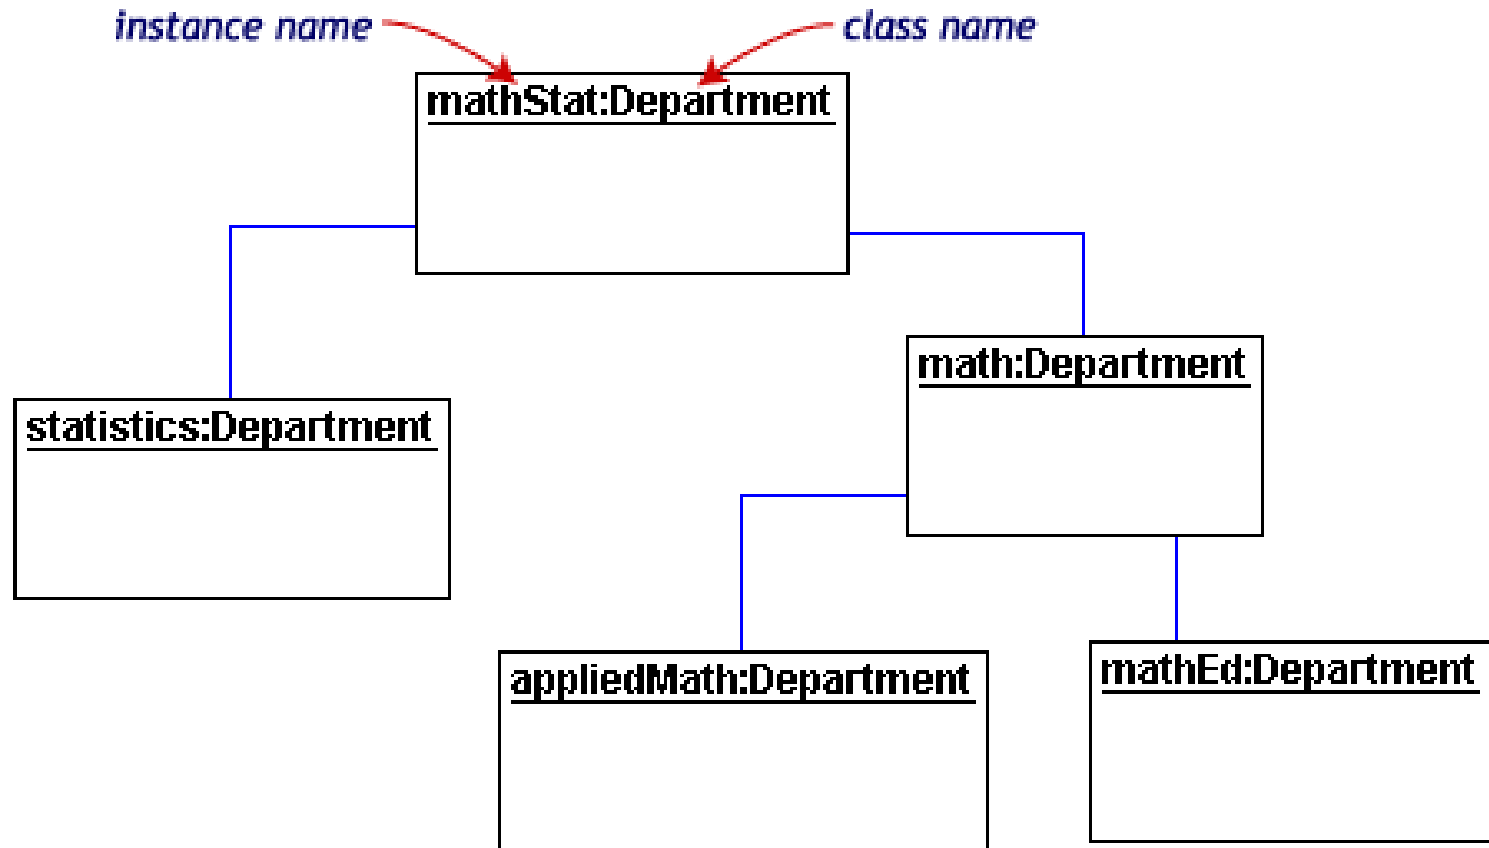

Deployment diagram

Object diagrams

- [UML 2 Object diagrams](#) (instance diagrams), are useful for exploring real world examples of objects and the relationships between them. It shows instances instead of classes. They are useful for explaining small pieces with complicated relationships, especially recursive relationships.

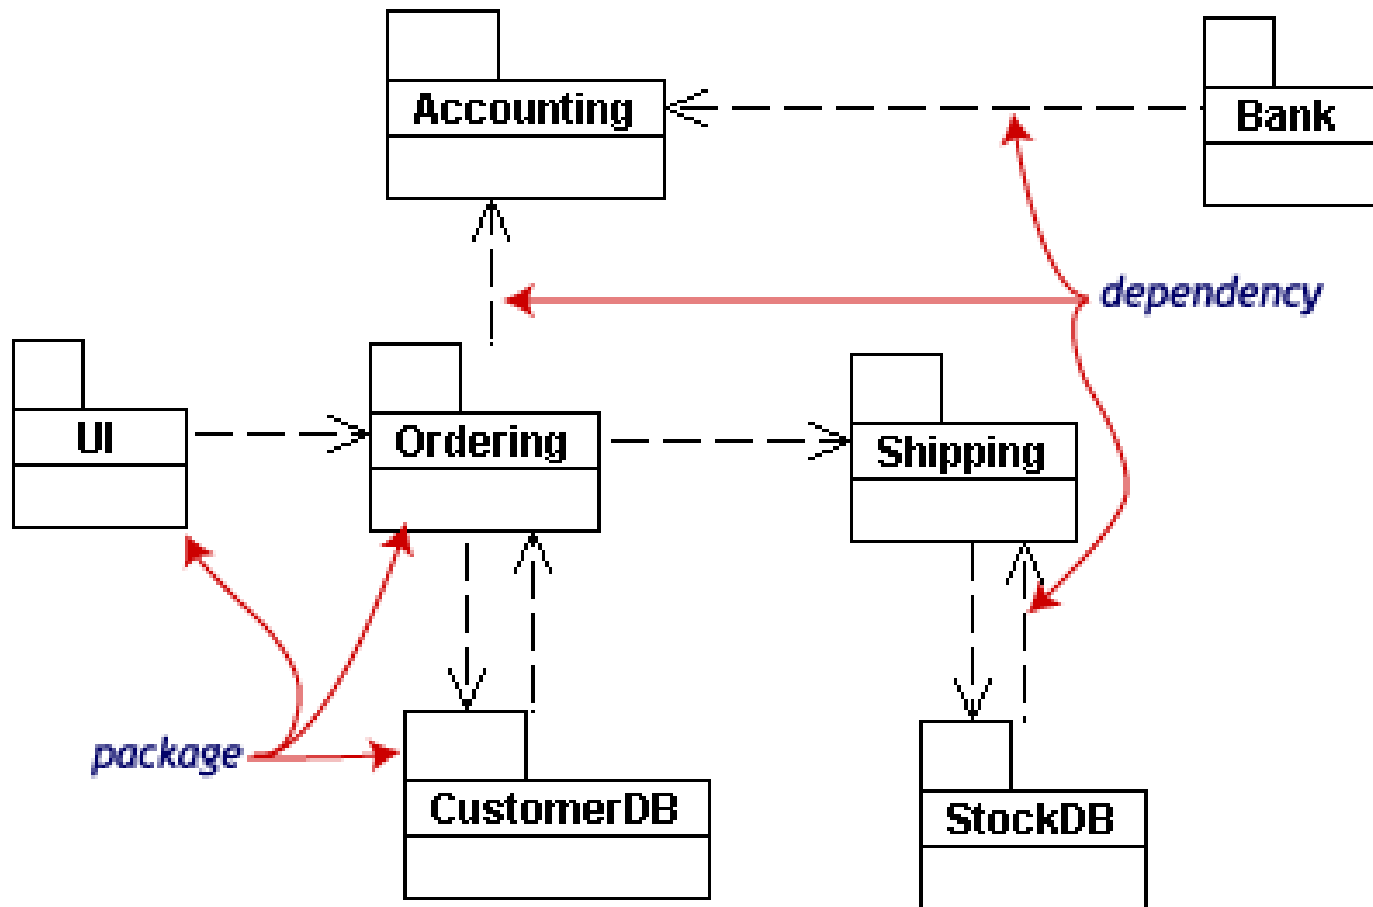

Object diagram

Package diagrams

- [UML 2 Package diagrams](#) simplify complex class diagrams, it can group classes into **packages**. A package is a collection of logically related UML elements. Packages are depicted as file folders and can be used on any of the UML diagrams.

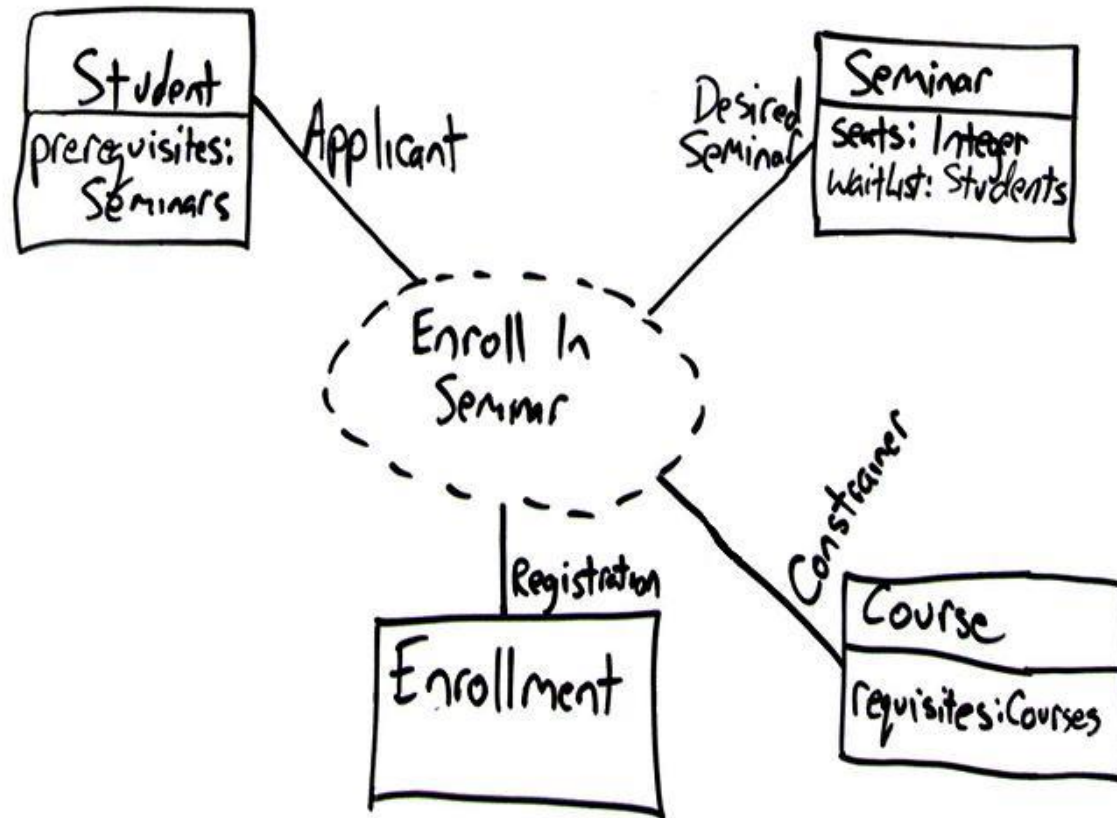

Package diagram

Composite structure diagram

- [UML 2 Composite structure diagrams](#)
used to explore run-time instances of interconnected instances collaborating over communications links. It shows the internal structure (including parts and connectors) of a structured classifier or collaboration.

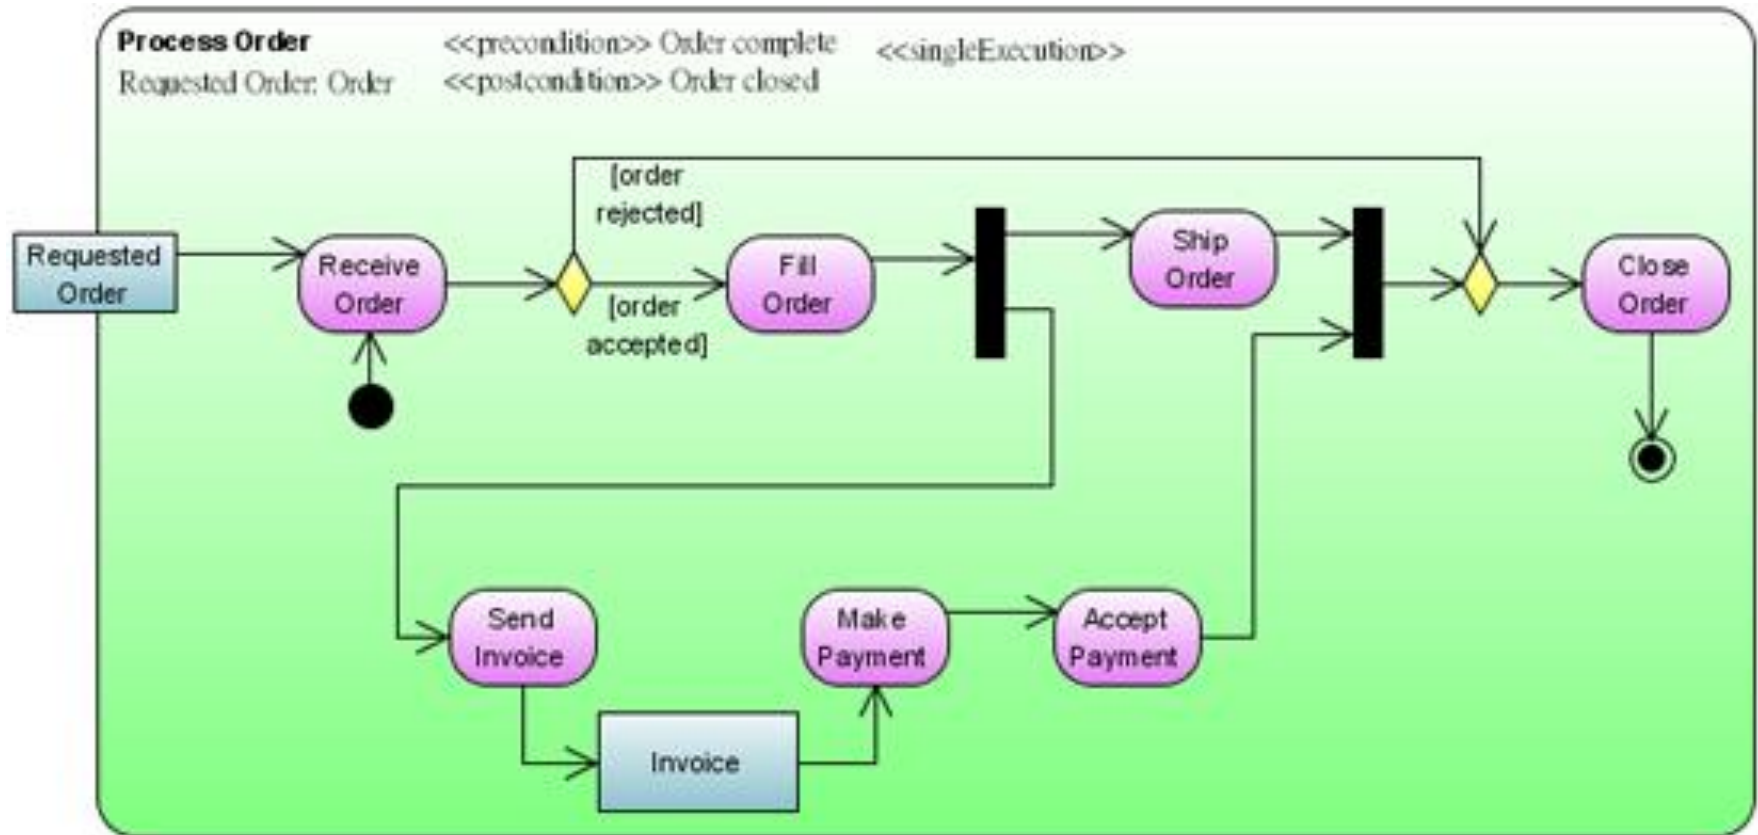

Composite structure diagrams

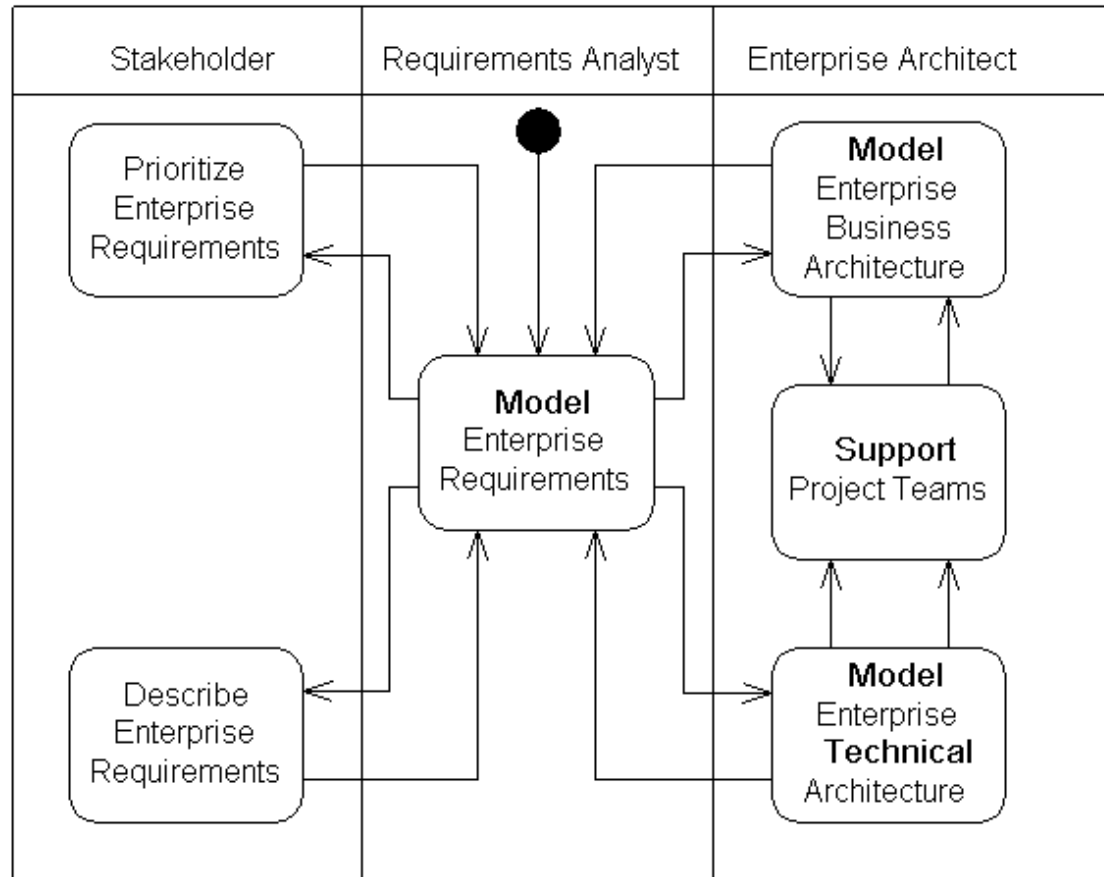

Activity diagrams

- [UML 2 Activity diagrams](#) helps to describe the flow of control of the target system, such as the exploring complex business rules and operations, describing the use case also the business process. It is object-oriented equivalent of flow charts and data-flow diagrams (DFDs).

Activity diagram

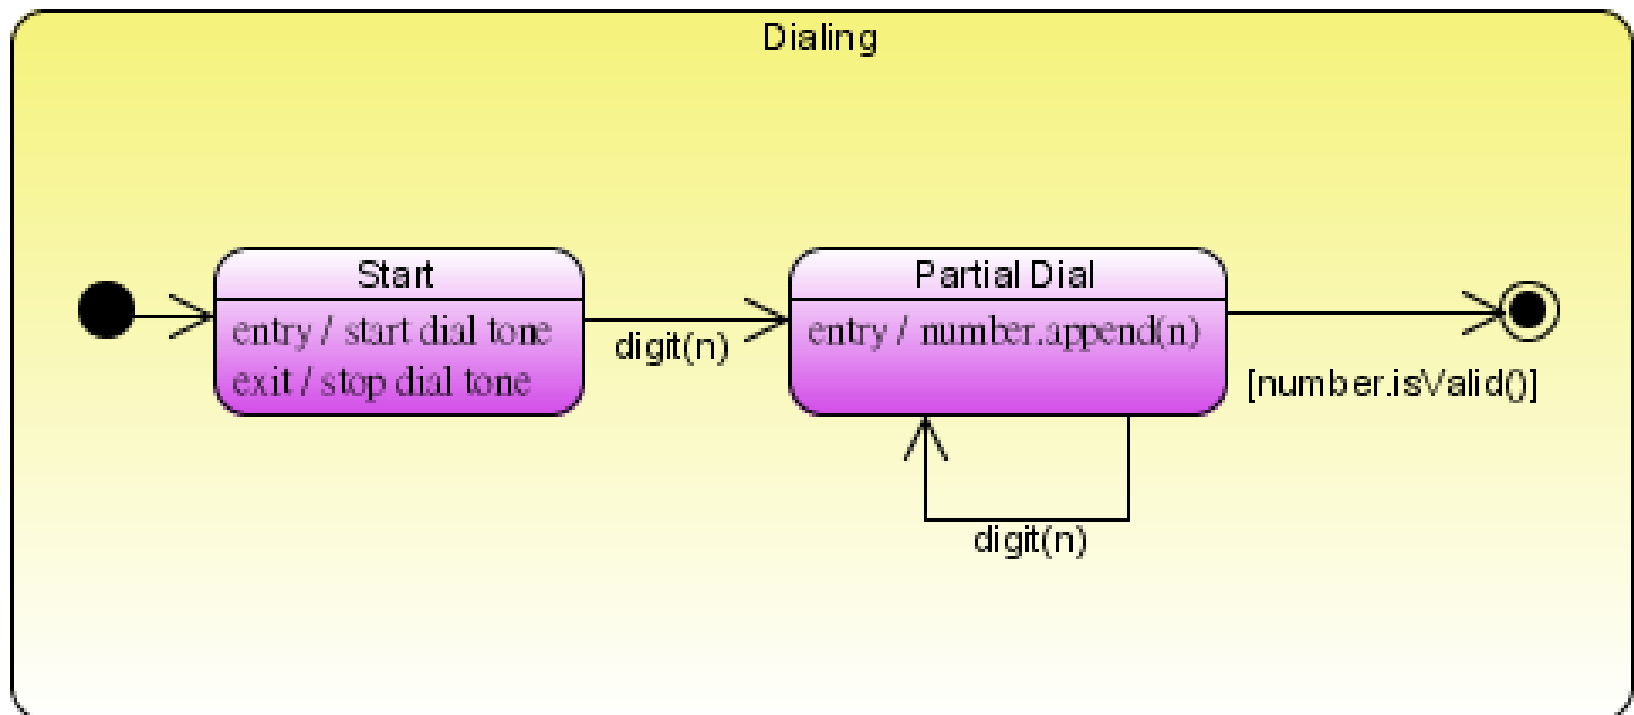

Activity diagram

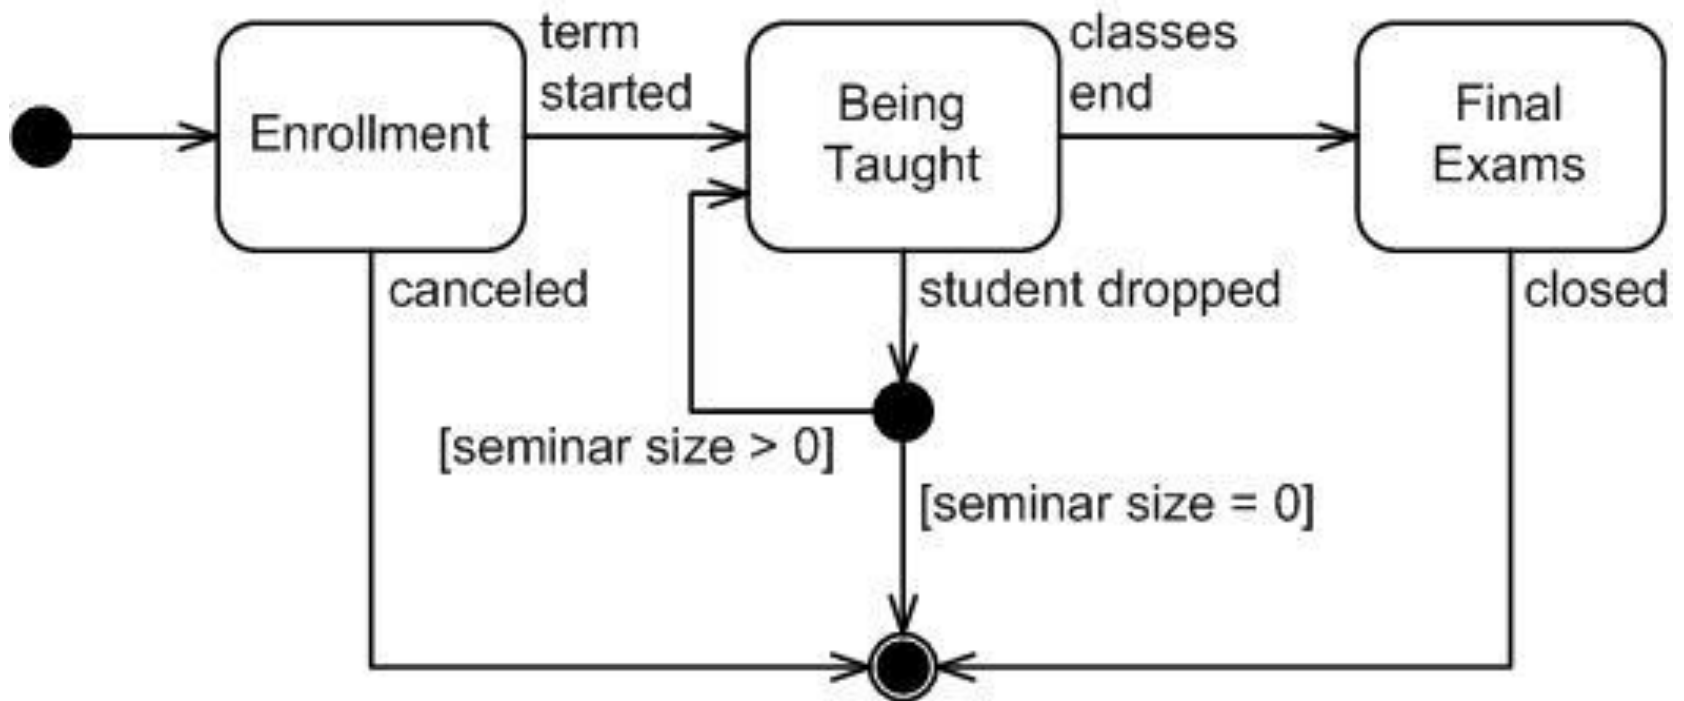

State machine diagram

- [UML 2 State machine diagrams](#) can show the different states of an entity also how an entity responds to various events by changing from one state to another. The history of an entity can best be modeled by a finite state diagram.

State machine diagram

State machine diagram

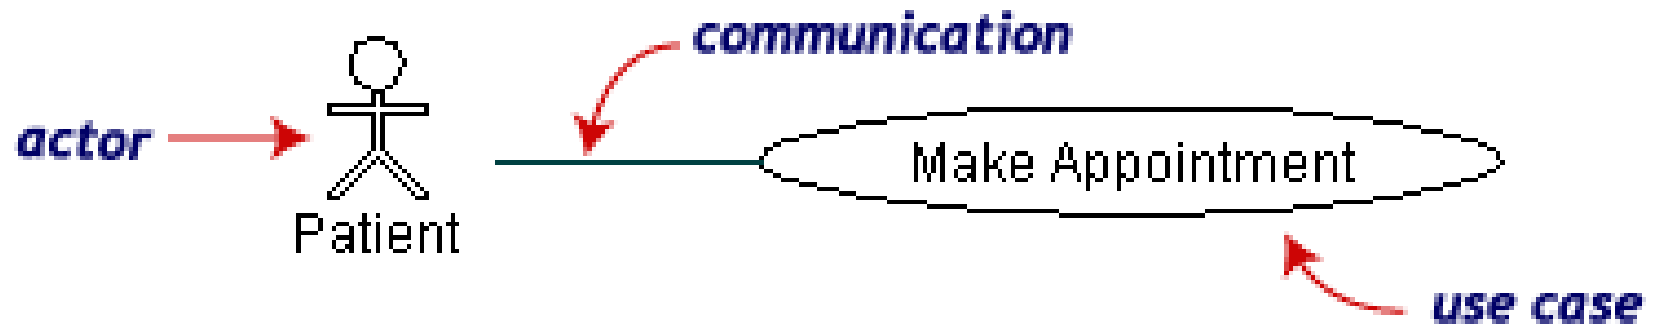

Use cases diagram

UML 2 Use cases diagrams describes the behavior of the target system from an external point of view. Use cases describe "the meat" of the actual requirements.

- **Use cases.** A use case describes a sequence of actions that provide something of measurable value to an actor and is drawn as a horizontal ellipse.
- **Actors.** An actor is a person, organization, or external system that plays a role in one or more interactions with your system. Actors are drawn as stick figures.
- **Associations.** Associations between actors and use cases are indicated by solid lines. An association exists whenever an actor is involved with an interaction described by a use case.

Use cases diagram

Use cases diagram

```

    usecaseDiagram
        actor Student
        actor Financial_Institution as Financial Institution
        actor Grade_Administrator as Grade Administrator
        actor Instructor
        actor Post_Office as Post Office
        actor Registrar
        actor Researcher

        Student --> UC1[Obtain Student Grant]
        Student --> UC2[Obtain Student Loan]
        Student --> UC3[Reimburse Course Fees]
        Student --> UC4[Pay Fees]
        Student --> UC5[Enroll in seminar]
        Student --> UC6[Drop seminar]
        Student --> UC7[Attend seminar]
        Student --> UC8[Finish seminar]
        Student --> UC9[Drop out of School]
        Student --> UC10[Graduate From School]

        Financial_Institution --> UC1
        Financial_Institution --> UC2
        Financial_Institution --> UC3
        Financial_Institution --> UC4

        Grade_Administrator --> UC11[Input student marks]

        Instructor --> UC12[Print Teaching Schedule]
        Instructor --> UC13[Teach Seminar]

        Post_Office --> UC14[Distribute Transcripts]
        Post_Office --> UC15[Distribute Fee Schedule]
        Post_Office --> UC16[Distribute Information to Students]

        Registrar --> UC16
        Registrar --> UC17[Distribute Schedules]
        Registrar --> UC18[Apply for Grant]

        Researcher --> UC18

        UC14 <--> UC16
        UC15 <--> UC16
        UC17 <--> UC16

        UC14 -.-> UC16 : <<extend>>
        UC15 -.-> UC16 : <<extend>>
        UC17 -.-> UC16 : <<extend>>
    
```

Communication diagram

- UML 2 Communication diagrams used to model the dynamic behavior of the use case. When compare to Sequence Diagram, the Communication Diagram is more focused on showing the collaboration of objects rather than the time sequence.

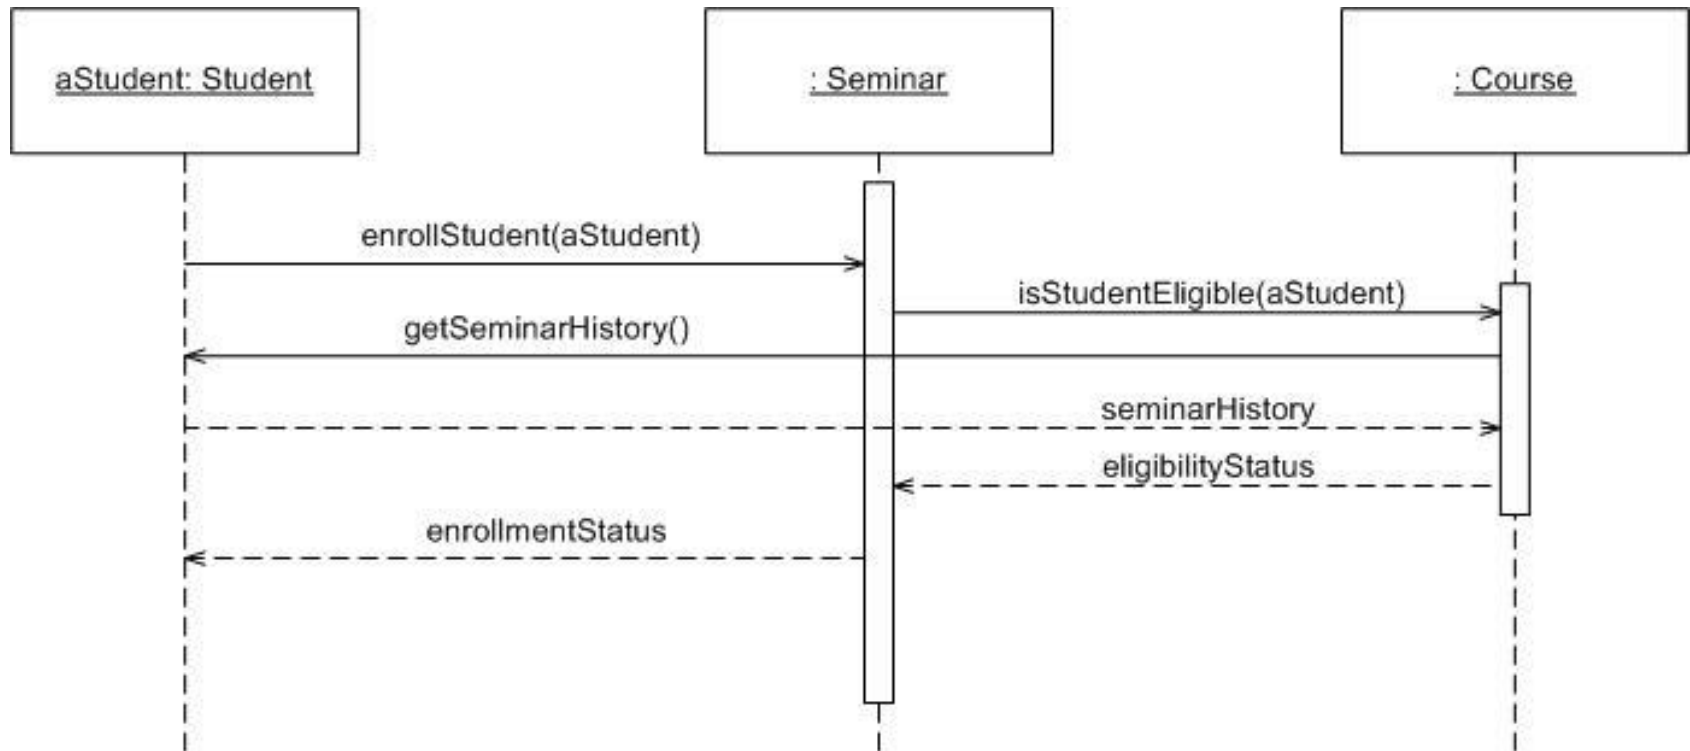

Communication diagram

Sequence diagram

- UML 2 Sequence diagrams models the collaboration of objects based on a time sequence. It shows how the objects interact with others in a particular scenario of a use case.

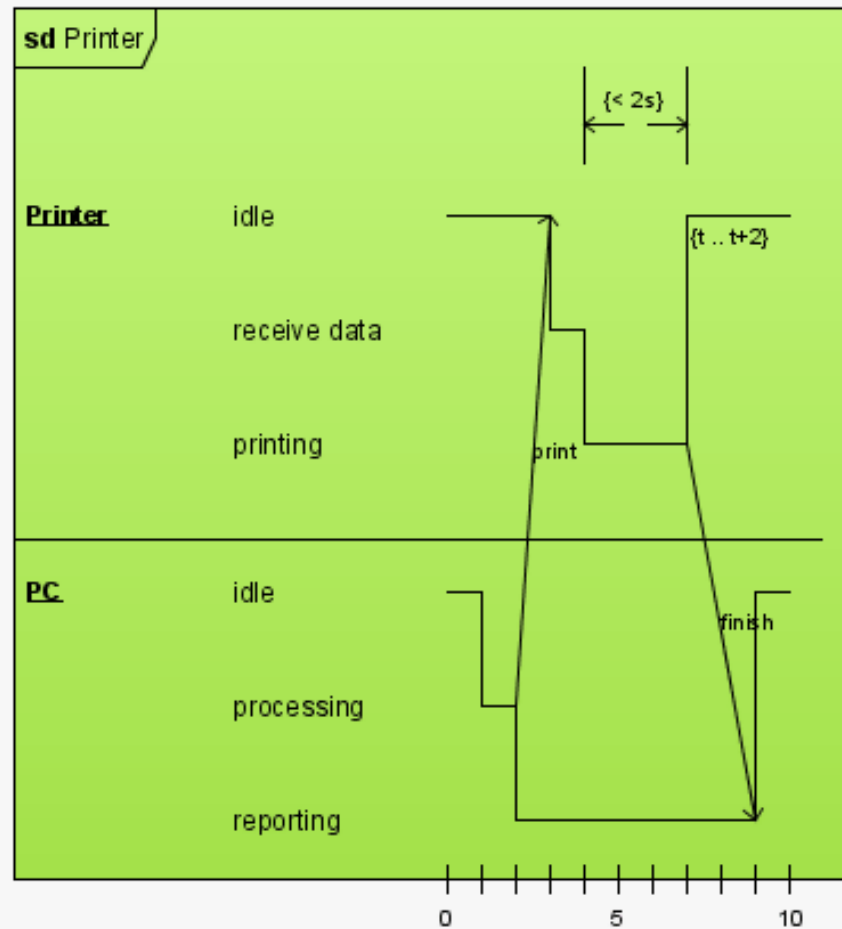

Sequence diagram

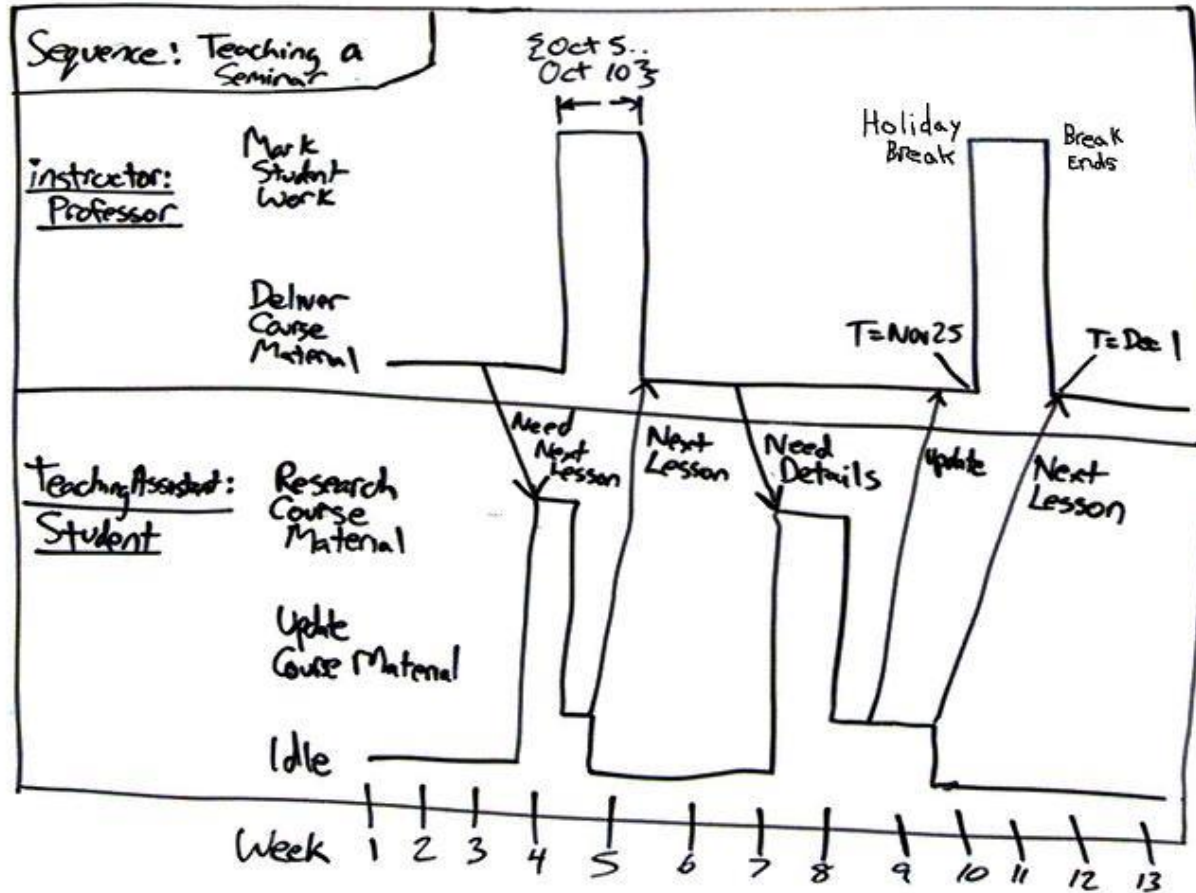

Timing diagram

- [UML 2 Timing diagrams](#) shows the behavior of the objects in a given period of time. Timing diagram is a special form of a sequence diagram. The differences between timing diagram and sequence diagram are the axes are reversed so that the time are increase from left to right and the lifelines are shown in separate compartments arranged vertically.

Timing diagram

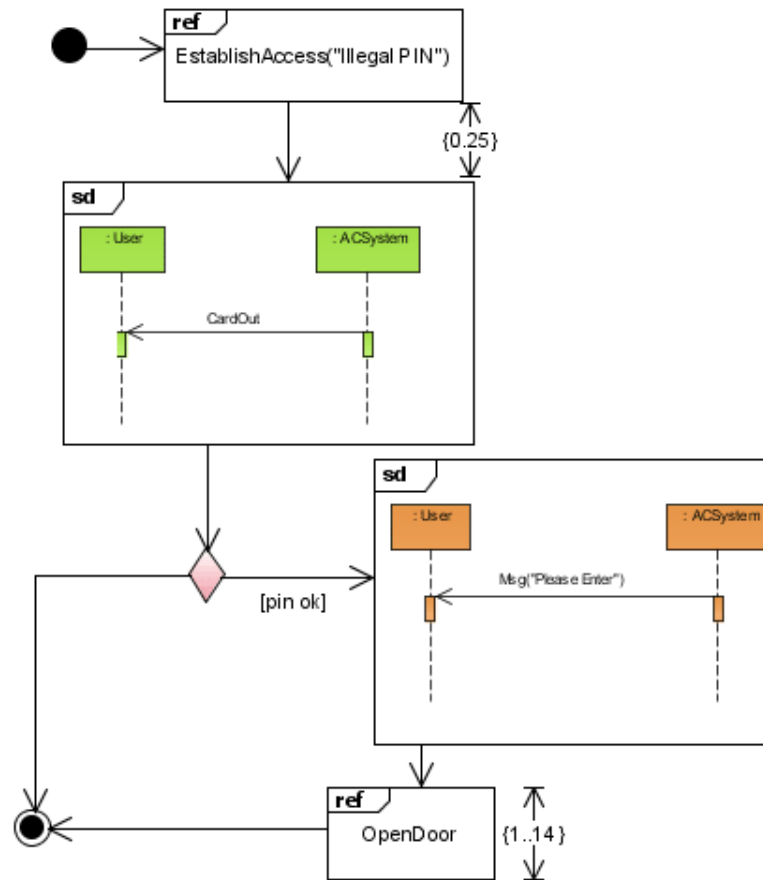

Timing diagram

Interaction overview diagram

- [UML 2 Interaction overview diagrams](#)
focuses on the overview of the flow of control of the interactions. It is a variant of the Activity Diagram where the nodes are the interactions or interaction occurrences. It describes the interactions where messages and lifelines are hidden.

Interaction overview diagram
